Managing your references can be a challenging task considering the level of detail that it takes to come up with a flawless list of references. Though Mendeley automatically formats references for you, it is still relevant for researchers to understand basic aspects of formatting references suggested by the American Psychological Association (APA).

Journal Article (1 author)

Though Mendeley automatically collects and organizes all the information required to create references (see video Accessing Databases and Managing References for more information), sometimes this information needs to be entered manually. The example below shows you the basic information needed to store references for journal articles in Mendeley.

a. **Type of source:** journal article
b. **Name of article:** Functional asymmetry of the brain in dichotic listening
c. **Authors:** Kimura, Doreen
d. **Journal:** Cortex
e. **Year:** 1967
f. **Volume:** 3
g. **Issue:** 2
h. **Pages:** 163-178
Follow the same steps described for one-author articles, then click on “authors”, and hit “enter” to add two or more authors.

After following these steps you will be able to insert references automatically to a Word document from Mendeley. You will not need to worry about formatting your bibliography as this will be done by the software. Your list of reference would look like this:

References
